

I fully concur with Mr Briggs, K1ZM and Mr Trippett II, WH2V.
The band segments need to be protected for narrow band modes.
It is very easy to filter out CW when using SSB with a single push
of the "Auto Notch" function switch. The reverse is not true, and
I have not been able to filter out SSB signals overlapping the CW
signals I attempt to copy. This is very apparent on the 80 meter
Novice/Tech Plus Sub band where Canadian SSB stations have invaded.
The band plan set aside for narrowband signals must be enforceable
if we are able to continue to use and enjoy these weak signal modes.
